Table of Contents:

Organisation Overview:

Organisation name: Shoprite

It was founded in 1979 by PEP Stores when a grocery company that had 8 stores were purchased from the Geller and Rogut families, these stores were in the Western Cape. Then in 1983 it has branched out to the Northern Cape which was the first store that was not in the Northern Cape. Then branched out to other provinces in the following years.

Shoprite's vision is to provide affordable goods and services to the public. Along with the uplifting the community by providing jobs and becoming Africa's largest omnichannel retailer. Their target audience branches from low income to middle class households due to their stance of selling their goods at an affordable price.

Website Goals and objectives:

The website's goal would be to increase the traffic that is already on the original website, along with help boost product sales and provide information about the products for the customer.

The KPI's the website would be using are finding out how visitors enter our website by looking at the traffic sources of the website. The other being counting how many unique visitors have accessed our website.

Current Website Analysis:

The current website has strengths like being eye-catching with the use of vibrant colours in this case being yellow and red. The contact details for the also easily found and accessible at the footer of the website. The products on the site are clearly labelled and are well detailed in their description. However, there are weaknesses to the website such as everything being in one place which could overwhelm the visitor. Along with ads that could take them out of what they are looking for.

These weaknesses can be easily solved by removing the ads having them in their separated sections of the website instead of right in the middle of the page. You can also streamline the browsing experience by removing the excess parts of the homepage.

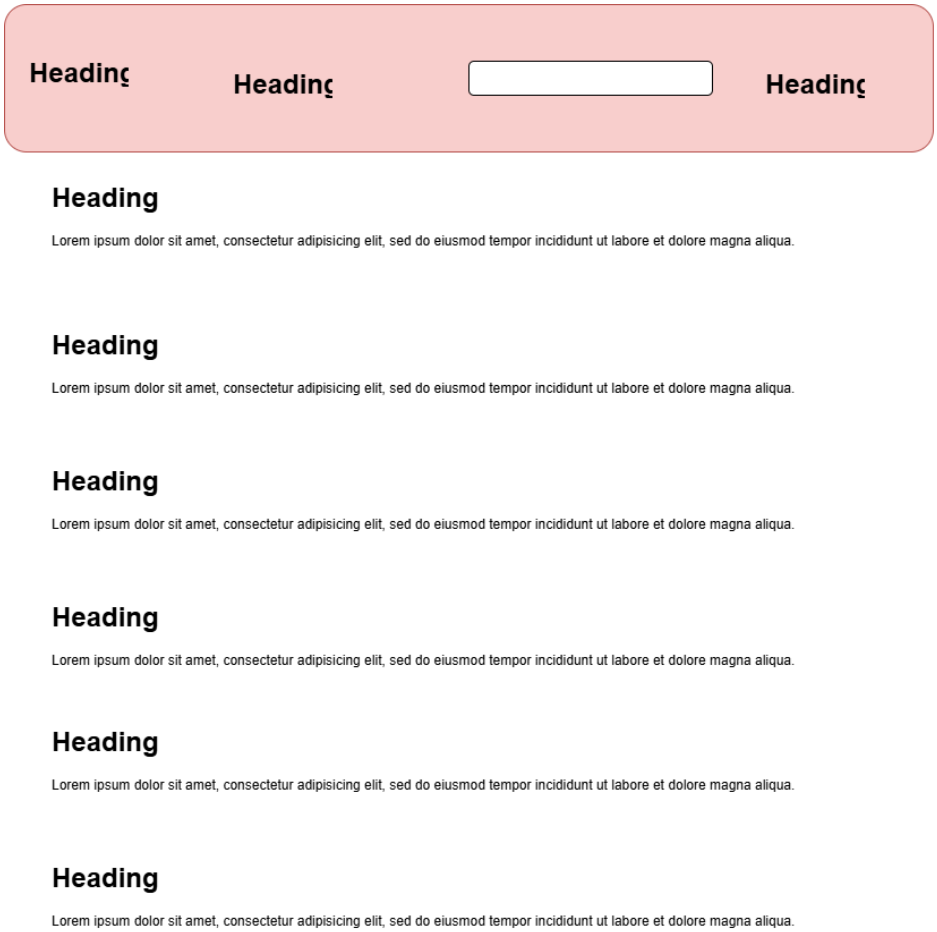

Proposed website features and functionality:

The website I am proposing would have a homepage that would give you a snippet of the products and services sold in as the visitor looks at the page, they would have a more streamlined experience. An about us page that has all the relevant information about the company, a contact page for all complaints or queries that customers may have. A separate tab for all the products in its respective department.

Design and user experience:

I will be using the well-known colours of red and yellow for my website they are associated with the Shoprite brand. I will be using medium sized font for words then large font for the numbers. The layout of the website would have large pictures along with the name and price of the product, having a header and footer for the tabs. This will make it eye catching and accessible to visitors of the website.

About us page:

Technical Requirements:

I will be using HTML as the foundation of the website and creating the overall layout of the website. Then I will be using CSS for the design of the website. JavaScript after to make sure the website works as it should.

Timeline and milestones:

I will complete the foundation of the website on the 14th of August. Then by the September 18th the design of the website would be complete.

Budget:

The estimation for the expected price for the would be upwards of 10 thousand rands, extra expenses would be for the general upkeep of the website would go an extra 5 thousand rands for the endeavour.

Proposal 2:

Organization overview

Organization Name: JAM Clothing

JAM Clothing was founded on 1998 by Michael Ditz and he had done so when he realised that customers are more willing to buy products when it has a low and affordable price on clothing. He was later joined by Grant Fraser and Dave Altshuler to turn the wholesaler to a popular retailer chain. The target market being customers who want cheap and affordable clothing whether they be low income or not.

Website Goals and objectives

The goal for the website is to boost traffic of the current website along with boosting clothing sales. And informing the visitor on what they are shopping for. The KPI I shall be using for the website will be checking the traffic sources as in how the visitor found the website.

Current Website analysis

The current website has bright colours that correspond with the brand along with pictures that can catch the visitor's eye on what kind of clothing the website sells. However, there are weaknesses such as lack of information on some products and how cluttered the website is on some places.

These weaknesses can be improved by removing any unnecessary parts that does not contribute to the users experience along with adding more information of the clothing.

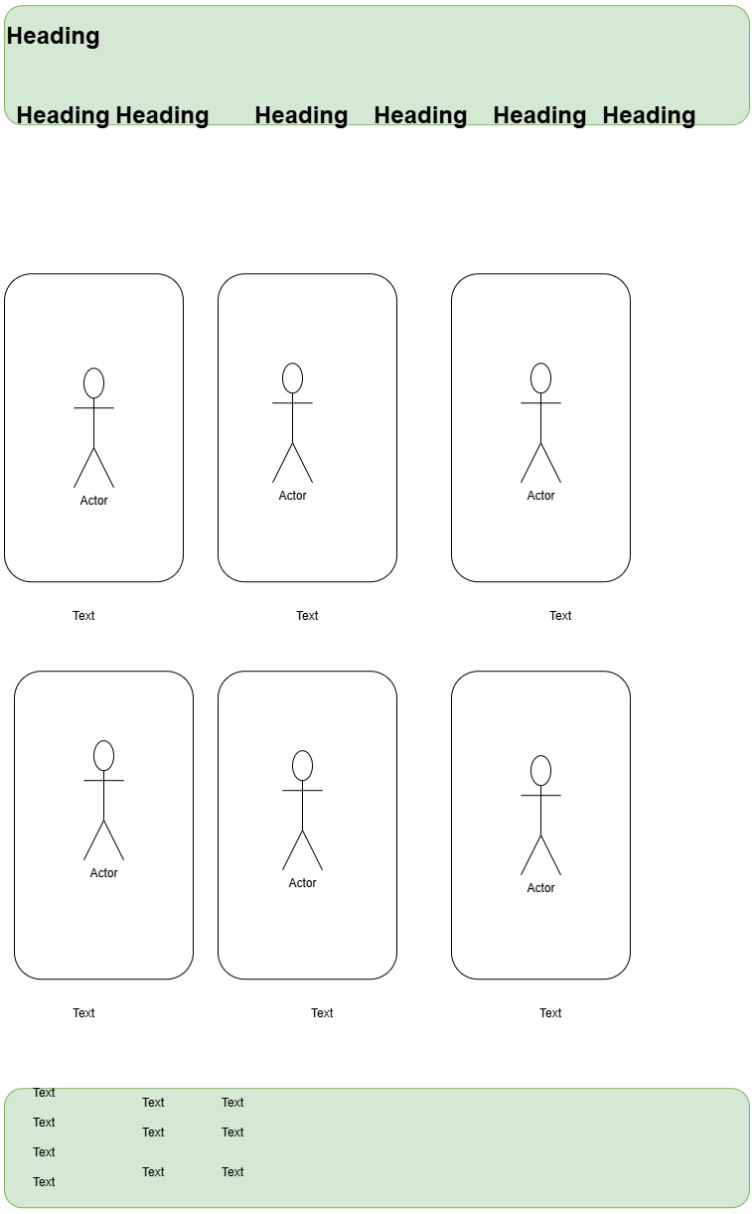

Proposed Website Features:

The homepage will feature a shortlist of clothing of different departments to give the visitor something to look at as they look through the page. An about us page for information about the company. The contact page for any queries the visitor may have about the products. And the product page for all the clothing that the website sells.

Design and User experience

I will be using the green colour in different shades as the brand usually uses, medium to large fonts will be used on the website. The layout of the website would feature large pictures for the clothing, between the footer and the header of the website. This would make accessible to visitors that may not be able to see properly.

Homepage:

Technical Requirements:

I will be using HTML for the backbone of the website and as a rough draft of whats to come. CSS will be after to make the website visually appealing for the visitor. JavaScript will be used to upkeep the behaviour of the website.

Timeline and Milestones:

The HTML aspect of the website will be finished by 14th of August; the CSS portion of the website will be finished on the 18th of September.

Budget:

The starting offer of the website would be at 10 thousand rands, and more funds would be allocated for the overall upkeep of the website which would give us a total of 15 thousand rands.
